

build passing

promise

ECMAScript 2015 Promise polyfill with Fiber support

The static methods `Promise.async` and `Promise.await` implement the relaxed `async` and `await` functions proposed in this talk: [Why Fibers Make Sense For Meteor](#).

Note: as of [v0.4.0](#), this library no longer depends directly on the [fibers](#) package. If you want to use this library in a codebase that uses `Fiber`s, make sure to set `Promise.Fiber` to the `Fiber` constructor that you use elsewhere. For example, [here](#) is how it's done in the test code for this repository.

If you'd like to use this [package](#) in a [Meteor](#) project, a much simpler approach is simply to run `meteor add promise`.
