

autoupdate

[Source code of released version](#) | [Source code of development version](#)

This package is the heart of Meteor's Hot Code Push functionality. It has a client component and a server component. The client component uses a DDP API provided by the server to subscribe to the version ID of the most recent build of the app's client. When it sees that a new version is available, it uses the [reload](#) package (if included in the app) to gracefully save the app's state and reload it in place.

`autoupdate` is part of the [Webapp](#) project.
