## FrameWaitForFunctionOptions interface

Signature:

```
export interface FrameWaitForFunctionOptions
```

### Properties

Property	Type	Description
polling?	string   number	(Optional) An interval at which the pageFunction is executed, defaults to raf. If polling is a number, then it is treated as an interval in milliseconds at which the function would be executed. If polling is a string, then it can be one of the following values:- raf - to constantly execute pageFunction in requestAnimationFrame callback. This is the tightest polling mode which is suitable to observe styling changes.- mutation - to execute pageFunction on every DOM mutation.
timeout?	number	(Optional) Maximum time to wait in milliseconds. Defaults to 30000 (30 seconds). Pass 0 to disable the timeout. Puppeteer's default timeout can be changed using Page.setDefaultTimeout().
