

# No Page Custom Font

## Why This Error Occurred

- The custom font you're adding was added to a page - this only adds the font to the specific page and not the entire application.
- The custom font you're adding was added to a separate component within `Document` - this disables automatic font optimization.

## Possible Ways to Fix It

Create the file `./pages/_document.js` and add the font to a custom `Document`:

```
// pages/_document.js
```

```
import Document, { Html, Head, Main, NextScript } from 'next/document'
```

```
class MyDocument extends Document {  
  render() {  
    return (  
      <Html>  
        <Head>  
          <link  
            href="https://fonts.googleapis.com/css2?family=Inter&display=optional"  
            rel="stylesheet"  
          />  
        </Head>  
        <body>  
          <Main />  
          <NextScript />  
        </body>  
      </Html>  
    )  
  }  
}
```

```
export default MyDocument
```

Or as a function component:

```
// pages/_document.js
```

```
import { Html, Head, Main, NextScript } from 'next/document'
```

```
export default function Document() {  
  return (  
    <Html>  
      <Head>
```

```

        <link
          href="https://fonts.googleapis.com/css2?family=Inter&display=optional"
          rel="stylesheet"
        />
      </Head>
      <body>
        <Main />
        <NextScript />
      </body>
    </Html>
  )
}

```

### When Not To Use It

If you have a reason to only load a font for a particular page or don't care about font optimization, then you can disable this rule.
