

Updating topics through the GitHub user interface

This topic describes how to submit pull requests to the Angular repository using GitHub's user interface. If you are unfamiliar with [Git](#), you might find this process easier for making changes.

Using the GitHub user interface for updates is recommended only for small changes to one file at a time, such as fixing typos, [updating the review date](#) or [updating search keywords](#).

To update a topic through the GitHub user interface:

1. Navigate to the topic for which you want to file a pull request.
2. Click the edit icon at the top of the topic.

 The edit icon for an Angular topic.

A GitHub page appears, displaying the source of the topic.

3. Update the topic.
4. At the bottom of the screen, update the **Commit changes** box with a description of the change. Use the format `docs: <short-description-of-change> , where <short-description-of-change>` briefly describes your change. Keep the description under 100 characters. For example:

```
docs: fix typo in Tour of Heroes pt.1
```

1. Verify that the **create new branch** option is selected, then click **Commit changes**.

A Pull Request screen opens.

1. Fill out the form in the Pull Request screen. At a minimum, put an `x` in the **Docs have been added / updated** option and the **Documentation content changes** option.
2. Click **Create pull request**.

At this point, your pull request is added to a list of current requests, which the documentation team reviews weekly.
