ElementHandle.select() method

Triggers a `change` and `input` event once all the provided options have been selected. If there's no `<select>` element matching `selector`, the method throws an error.

Signature:

```
select(...values: string[]): Promise<string[]>;
```

Parameters

Parameter	Type	Description
values	string[]	Values of options to select. If the <code><select></code> has the <code>multiple</code> attribute, all values are considered, otherwise only the first one is taken into account.

Returns:

Promise<string[]>

Example

```
handle.select('blue'); // single selection
handle.select('red', 'green', 'blue'); // multiple selections
```
