

The `random` package provides several functions for generating random numbers. It uses a cryptographically strong pseudorandom number generator when possible, but falls back to a weaker random number generator when cryptographically strong randomness is not available (on older browsers or on servers that don't have enough entropy to seed the cryptographically strong generator).

```
{% apibox "Random.id" %} {% apibox "Random.secret" %} {% apibox "Random.fraction" %} {% apibox  
"Random.choice" %} {% apibox "Random.hexString" %}
```
