

# fzf

This plugin tries to find [junegunn's fzf](#) based on where it's been installed, and enables its fuzzy auto-completion and key bindings.

To use it, add `fzf` to the plugins array in your zshrc file:

```
plugins=(... fzf)
```

## Settings

All these settings should go in your zshrc file, before Oh My Zsh is sourced.

### **FZF\_BASE**

Set to fzf installation directory path:

```
export FZF_BASE=/path/to/fzf/install/dir
```

### **FZF\_DEFAULT\_COMMAND**

Set default command to use when input is tty:

```
export FZF_DEFAULT_COMMAND='<your fzf default command>'
```

If not set, the plugin will try to set it to these, in the order in which they're found:

- [fd](#)
- [rg](#)
- [ag](#)

### **DISABLE\_FZF\_AUTO\_COMPLETION**

Set whether to load fzf auto-completion:

```
DISABLE_FZF_AUTO_COMPLETION="true"
```

### **DISABLE\_FZF\_KEY\_BINDINGS**

Set whether to disable key bindings (CTRL-T, CTRL-R, ALT-C):

```
DISABLE_FZF_KEY_BINDINGS="true"
```
