## FileChooser class

File choosers let you react to the page requesting for a file.

Signature:

```
export declare class FileChooser
```

## Remarks

`FileChooser` objects are returned via the `page.waitForFileChooser` method.

The constructor for this class is marked as internal. Third-party code should not call the constructor directly or create subclasses that extend the `FileChooser` class.

## Example

An example of using `FileChooser`:

```
const [fileChooser] = await Promise.all([
  page.waitForFileChooser(),
  page.click('#upload-file-button'), // some button that triggers file selection
]);
await fileChooser.accept(['/tmp/myfile.pdf']);
```

**\*\*NOTE\*\*** In browsers, only one file chooser can be opened at a time. All file choosers must be accepted or canceled. Not doing so will prevent subsequent file choosers from appearing.

## Methods

Method	Modifiers	Description
<code>accept(filePaths)</code>		Accept the file chooser request with given paths.
<code>cancel()</code>		Closes the file chooser without selecting any files.
<code>isMultiple()</code>		Whether file chooser allow for multiple file selection.
