

Next.js + MDX

Use MDX with Next.js

Installation

```
npm install @next/mdx @mdx-js/loader
```

or

```
yarn add @next/mdx @mdx-js/loader
```

Usage

Create a `next.config.js` in your project

```
// next.config.js
const withMDX = require('@next/mdx')()
module.exports = withMDX()
```

Optionally you can provide MDX plugins:

```
// next.config.js
const withMDX = require('@next/mdx')({
  options: {
    remarkPlugins: [],
    rehypePlugins: [],
  },
})
module.exports = withMDX()
```

Optionally you can add your custom Next.js configuration as parameter

```
// next.config.js
const withMDX = require('@next/mdx')({
  module.exports = withMDX({
    webpack(config, options) {
      return config
    },
  })
})
```

Optionally you can match other file extensions for MDX compilation, by default only `.mdx` is supported

```
// next.config.js
const withMDX = require('@next/mdx')({
  extension: /\.md|mdx$/,
})
module.exports = withMDX()
```

Top level .mdx pages

Define the `pageExtensions` option to have Next.js handle `.md` and `.mdx` files in the `pages` directory as pages:

```
// next.config.js
const withMDX = require('@next/mdx')({
  extension: /\.mdx?$/,
})
module.exports = withMDX({
  pageExtensions: ['js', 'jsx', 'ts', 'tsx', 'md', 'mdx'],
})
```

TypeScript

Follow this guide from the MDX docs.
