

next export with Image API

Why This Error Occurred You are attempting to run `next export` while importing the `next/image` component using the default `loader` configuration.

However, the default `loader` relies on the Image Optimization API which is not available for exported applications.

This is because Next.js optimizes images on-demand, as users request them (not at build time).

Possible Ways to Fix It

- Use `next start` to run a server, which includes the Image Optimization API.
- Use any provider which supports Image Optimization (such as Vercel).
- Configure the loader in `next.config.js`.
- Use the `loader` prop for each instance of `next/image`.
