

Adding to an existing integration test

The test tasks are stored in the `tests/integration/targets/<target_name>/tasks` directory.

The `main.yml` file holds test tasks and includes other test files. Look for a suitable test file to integrate your tests or create and include / import a separate test file. You can use one of the existing test files as a draft.

When fixing a bug

When fixing a bug:

1. `ref: Determine if integration tests for the module exist<collection_integration_prepare>``. If they do not, see `ref: collection_creating_integration_tests`` section.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 17); backlink
Unknown interpreted text role "ref".
```

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 17); backlink
Unknown interpreted text role "ref".
```

2. Add a task which reproduces the bug to an appropriate file within the `tests/integration/targets/<target_name>/tasks` directory.
3. `ref: Run the tests<collection_run_integration_tests>``. The newly added task should fail.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 19); backlink
Unknown interpreted text role "ref".
```

4. If they do not fail, re-check if your environment / test task satisfies the conditions described in the `Steps to Reproduce` section of the issue.
5. If you reproduce the bug and tests fail, change the code.
6. `ref: Run the tests<collection_run_integration_tests>`` again.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 22); backlink
Unknown interpreted text role "ref".
```

7. If they fail, repeat steps 5-6 until the tests pass.

Here is an example.

Let's say someone reported an issue in the `community.postgresql` collection that when users pass a name containing underscores to the `postgresql_user` module, the module fails.

We cloned the collection repository to the `~/ansible_collections/community/postgresql` directory and `ref: prepared our environment <collection_prepare_environment>``. From the collection's root directory, we run `ansible-test integration --list-targets` and it shows a target called `postgresql_user`. It means that we already have tests for the module.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite]
[rst] [community] [collection_contributors]collection_integration Updating.rst, line 29);
```

[backlink](#)

Unknown interpreted text role "ref".

We start with reproducing the bug.

First, we look into the `tests/integration/targets/postgresql_user/tasks/main.yml` file. In this particular case, the file imports other files from the `tasks` directory. The `postgresql_user_general.yml` looks like an appropriate one to add our tests.

```
# General tests:
- import_tasks: postgresql_user_general.yml
  when: postgres_version_resp.stdout is version('9.4', '>=')
```

We will add the following code to the file.

```
# https://github.com/ansible-collections/community.postgresql/issues/NUM
- name: Test user name containing underscore
  postgresql_user:
    name: underscored_user
  register: result

- name: Check the module returns what we expect
  assert:
    that:
      - result is changed

- name: Query the database if the user exists
  postgresql_query:
    query: SELECT * FROM pg_authid WHERE rolename = 'underscored_user'
  register: result

- name: Check the database returns one row
  assert:
    that:
      - result.query_result.rowcount == 1
```

When we [ref:run the tests<collection_run_integration_tests>](#) with `postgresql_user` as a test target, this task must fail.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\[ansible-devel][docs][docsite][rst][community][collection_contributors]collection_integration Updating.rst, line 66);
[backlink](#)

Unknown interpreted text role "ref".

Now that we have our failing test; we will fix the bug and run the same tests again. Once the tests pass, we will consider the bug fixed and will submit a pull request.

When adding a new feature

Note

The process described in this section also applies when you want to add integration tests to a feature that already exists, but is missing integration tests.

If you have not already implemented the new feature, you can start with writing the integration tests for it. Of course they will not work as the code does not yet exist, but it can help you improve your implementation design before you start writing any code.

When adding new features, the process of adding tests consists of the following steps:

1. [ref:Determine if integration tests for the module exists<collection_integration_prepare>](#). If they do not, see [ref:collection_creating_integration_tests](#).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\[ansible-devel][docs][docsite][rst][community][collection_contributors]collection_integration Updating.rst, line 81); [backlink](#)

Unknown interpreted text role "ref".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors

```
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 81); backlink
```

Unknown interpreted text role "ref".

2. Find an appropriate file for your tests within the `tests/integration/targets/<target_name>/tasks` directory.
3. Cover your feature with tests. Refer to the [ref: Recommendations on coverage<collection_integration_recommendations>](#) section for details.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-
resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 83); backlink
```

Unknown interpreted text role "ref".

4. [ref: Run the tests<collection_run_integration_tests>](#).

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-
resources\ansible-devel\docs\docsite\rst\community\collection_contributors\
[ansible-devel] [docs] [docsite] [rst] [community]
[collection_contributors]collection_integration Updating.rst, line 84); backlink
```

Unknown interpreted text role "ref".

5. If they fail, see the test output for details. Fix your code or tests and run the tests again.
6. Repeat steps 4-5 until the tests pass.

Here is an example.

Let's say we decided to add a new option called `add_attribute` to the `postgresql_user` module of the `community.postgresql` collection.

The option is boolean. If set to `yes`, it adds an additional attribute to a database user.

We cloned the collection repository to the `~/ansible_collections/community/postgresql` directory and [ref: prepared our environment<collection_integration_prepare>](#). From the collection's root directory, we run `ansible-test integration --list-targets` and it shows a target called `postgresql_user`. Therefore, we already have some tests for the module.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-
devel\docs\docsite\rst\community\collection_contributors\[ansible-devel] [docs] [docsite]
[rst] [community] [collection_contributors]collection_integration Updating.rst, line 94);
backlink
```

Unknown interpreted text role "ref".

First, we look at the `tests/integration/targets/<target_name>/tasks/main.yml` file. In this particular case, the file imports other files from the `tasks` directory. The `postgresql_user_general.yml` file looks like an appropriate one to add our tests.

```
# General tests:
- import_tasks: postgresql_user_general.yml
  when: postgres_version_resp.stdout is version('9.4', '>=')
```

We will add the following code to the file.

```
# https://github.com/ansible-collections/community.postgresql/issues/NUM
# We should also run the same tasks with check mode: yes. We omit it here for simplicity.
- name: Test for new_option, create new user WITHOUT the attribute
  postgresql_user:
    name: test_user
    add_attribute: no
  register: result

- name: Check the module returns what we expect
  assert:
    that:
      - result is changed

- name: Query the database if the user exists but does not have the attribute (it is NULL)
  postgresql_query:
    query: SELECT * FROM pg_authid WHERE rolename = 'test_user' AND attribute = NULL
```

```

register: result

- name: Check the database returns one row
  assert:
    that:
      - result.query_result.rowcount == 1

- name: Test for new_option, create new user WITH the attribute
  postgresql_user:
    name: test_user
    add_attribute: yes
  register: result

- name: Check the module returns what we expect
  assert:
    that:
      - result is changed

- name: Query the database if the user has the attribute (it is TRUE)
  postgresql_query:
    query: SELECT * FROM pg_authid WHERE rolename = 'test_user' AND attribute = 't'
  register: result

- name: Check the database returns one row
  assert:
    that:
      - result.query_result.rowcount == 1

```

Then we [ref:run the tests<collection_run_integration_tests>](#) with `postgresql_user` passed as a test target.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\[ansible-devel] [docs] [docsite] [rst] [community] [collection_contributors]collection_integration Updating.rst, line 152);
[backlink](#)

Unknown interpreted text role "ref".

In reality, we would alternate the tasks above with the same tasks run with the `check_mode: yes` option to be sure our option works as expected in check-mode as well. See [ref:Recommendations on coverage<collection_integration_recommendations>](#) for details.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\community\collection_contributors\[ansible-devel] [docs] [docsite] [rst] [community] [collection_contributors]collection_integration Updating.rst, line 154);
[backlink](#)

Unknown interpreted text role "ref".

If we expect a task to fail, we use the `ignore_errors: yes` option and check that the task actually failed and returned the message we expect:

```

- name: Test for fail_when_true option
  postgresql_user:
    name: test_user
    fail_when_true: yes
  register: result
  ignore_errors: yes

- name: Check the module fails and returns message we expect
  assert:
    that:
      - result is failed
      - result.msg == 'The message we expect'

```
