

Home > puppeteer > WebWorker > evaluateHandle

WebWorker.evaluateHandle() method

The only difference between `worker.evaluate` and `worker.evaluateHandle` is that `worker.evaluateHandle` returns in-page object (JSHandle). If the function passed to the `worker.evaluateHandle` returns a `Promise`, then `worker.evaluateHandle` would wait for the promise to resolve and return its value. Shortcut for `await worker.executionContext().evaluateHandle(pageFunction, ...args)`

Signature:

```
evaluateHandle<HandlerType extends JSHandle> = JSHandle<(pageFunction: EvaluateHandleFn, ...args)
```

Parameters

Parameter	Type	Description
pageFunction	EvaluateHandleFn	Function to be evaluated in the page context.
args	SerializableOrJSHandle[]	Arguments to pass to pageFunction.

Returns:

Promise<JSHandle>

Promise which resolves to the return value of `pageFunction`.
