

Custom App

Next.js uses the `App` component to initialize pages. You can override it and control the page initialization. Which allows you to do amazing things like:

- Persisting layout between page changes
- Keeping state when navigating pages
- Custom error handling using `componentDidCatch`
- Inject additional data into pages
- Add global CSS

To override the default `App`, create the file `./pages/_app.js` as shown below:

```
// import App from 'next/app'

function MyApp({ Component, pageProps }) {
  return <Component {...pageProps} />
}

// Only uncomment this method if you have blocking data requirements for
// every single page in your application. This disables the ability to
// perform automatic static optimization, causing every page in your app to
// be server-side rendered.
//
// MyApp.getInitialProps = async (appContext) => {
//   // calls page's `getInitialProps` and fills `appProps.pageProps`
//   const appProps = await App.getInitialProps(appContext);
//   return { ...appProps }
// }

export default MyApp
```

The `Component` prop is the active **page**, so whenever you navigate between routes, `Component` will change to the new **page**. Therefore, any props you send to `Component` will be received by the **page**.

`pageProps` is an object with the initial props that were preloaded for your page by one of our data fetching methods, otherwise it's an empty object.

The `App.getInitialProps` receives a single argument called `context.ctx`. It's an object with the same set of properties as the `context` object in `getInitialProps`.

Caveats

- If your app is running and you added a custom `App`, you'll need to restart the development server. Only required if `pages/_app.js` didn't exist before.

- Adding a custom `getInitialProps` in your `App` will disable Automatic Static Optimization in pages without Static Generation.
- When you add `getInitialProps` in your custom app, you must `import App` from `"next/app"`, call `App.getInitialProps(appContext)` inside `getInitialProps` and merge the returned object into the return value.
- `App` currently does not support Next.js Data Fetching methods like `getStaticProps` or `getServerSideProps`.

TypeScript

If you're using TypeScript, take a look at our TypeScript documentation.
