

coffeescript-compiler

[Source code of released version](#) | [Source code of development version](#)

This package supports the `coffeescript` package, and any other packages that wish to compile CoffeeScript code into JavaScript. Like the `babel-compiler` package, the actual compilation is separated out from the build plugin so that packages besides the official `coffeescript` package can compile CoffeeScript code.

Testing This Package

Testing the `coffeescript` package also tests this one:

```
./meteor test-packages packages/non-core/coffeescript
```
