

next/script

- Examples
- Version History

Note: This is API documentation for the Script Component. For a feature overview and usage information for scripts in Next.js, please see [Script Optimization](#).

Optional Props

src

A path string specifying the URL of an external script. This can be either an absolute external URL or an internal path.

strategy

The loading strategy of the script.

strategy	Description
beforeInteractive	Load script before the page becomes interactive
afterInteractive	Load script immediately after the page becomes interactive
lazyOnload	Load script during browser idle time
worker	Load script in a web worker

Note: `worker` is an experimental strategy that can only be used when enabled in `next.config.js`. See [Off-loading Scripts To A Web Worker](#).

onLoad

A method that returns additional JavaScript that should be executed after the script has finished loading.

Note: `onLoad` can't be used with the `beforeInteractive` loading strategy.

The following is an example of how to use the `onLoad` property:

```
import { useState } from 'react'
import Script from 'next/script'

export default function Home() {
  const [stripe, setStripe] = useState(null)

  return (
    <>
      <Script
        id="stripe-js"
        src="https://js.stripe.com/v3/"
        onLoad={() => {
          setStripe({ stripe: window.Stripe('pk_test_12345') })
        }}
      />
    </>
  )
}
```
