

Anytime you need to display a piece of content—like an image with an optional caption, consider using a `<figure>`.

Use the included `.figure`, `.figure-img` and `.figure-caption` classes to provide some baseline styles for the HTML5 `<figure>` and `<figcaption>` elements. Images in figures have no explicit size, so be sure to add the `.img-fluid` class to your `` to make it responsive.

```
{{< example >}}
```

```
    {{< placeholder width="400" height="300" class="figure-img img-fluid rounded" >}}  
    A caption for the above image.
```

```
{{< /example >}}
```

Aligning the figure's caption is easy with our [text utilities]({{< docsref "/utilities/text#text-alignment" >}}).

```
{{< example >}}
```

```
    {{< placeholder width="400" height="300" class="figure-img img-fluid rounded" >}}  
    A caption for the above image.
```

```
{{< /example >}}
```

Sass

Variables

```
{{< scss-docs name="figure-variables" file="scss/_variables.scss" >}}
```
