

Gulp Tasks folder

This folder contains one file for each task (or group of related tasks) for the project's gulpfile. The dependencies between the tasks is kept in the gulpfile.

Task File Structure

Each task is defined by a factory function that accepts `gulp` as a parameter. Each file exports either one factory or an object of factories.

E.g. The `build.js` file contains only one task:

```
module.exports = (gulp) => (done) => {  
  ...  
};
```

Loading Tasks

The tasks are loaded in the gulp file, by requiring them. There is a helper called `loadTask(fileName, taskName)` will do this for us, where the `taskName` is optional if the file only exports one task.

E.g. Loading the task that will run the build, from a task file that contains only one task.

```
gulp.task('build.sh', loadTask('build'));
```
