

## Workqueue Example

This example demonstrates how to write a controller which follows the states of watched resources.

It demonstrates how to: \* combine the workqueue with a cache to a full controller  
\* synchronize the controller on startup

The example is based on <https://git.k8s.io/community/contributors/devel/sig-api-machinery/controllers.md>.

## Running

```
# if outside of the cluster
go run *.go -kubeconfig=/my/config
```
