

build passing

uuid

The uuid package generates and inspects UUIDs based on [RFC 4122](#) and DCE 1.1: Authentication and Security Services.

This package is based on the [github.com/pborman/uuid](#) package (previously named [code.google.com/p/go-uuid](#)). It differs from these earlier packages in that a UUID is a 16 byte array rather than a byte slice. One loss due to this change is the ability to represent an invalid UUID (vs a NIL UUID).

INSTALL

```
go get github.com/google/uuid
```

DOCUMENTATION

 [reference](#)

Full `go doc` style documentation for the package can be viewed online without installing this package by using the GoDoc site here: <http://pkg.go.dev/github.com/google/uuid>
