

Linking with `kind=framework` is only supported when targeting macOS, as frameworks are specific to that operating system.

Erroneous code example:

```
ignore (should-compile_fail-but-cannot-doctest-conditionally-without-macos)
#[link(name = "FooCoreServices", kind = "framework")] extern "C"
{} // OS used to compile is Linux for example
```

To solve this error you can use conditional compilation:

```
#[cfg_attr(target="macos", link(name = "FooCoreServices", kind = "framework"))]
extern "C" {}
```

Learn more in the Conditional Compilation section of the Reference.
