

Running Rustfmt from Atom

RLS

Rustfmt is included with the Rust Language Server, itself provided by [ide-rust](#).

```
apm install ide-rust
```

Once installed a file is formatted with `ctrl-shift-c` or `cmd-shift-c`, also available in context menu.

atom-beautify

Another way is to install [Beautify](#), you can do this by running `apm install atom-beautify`.

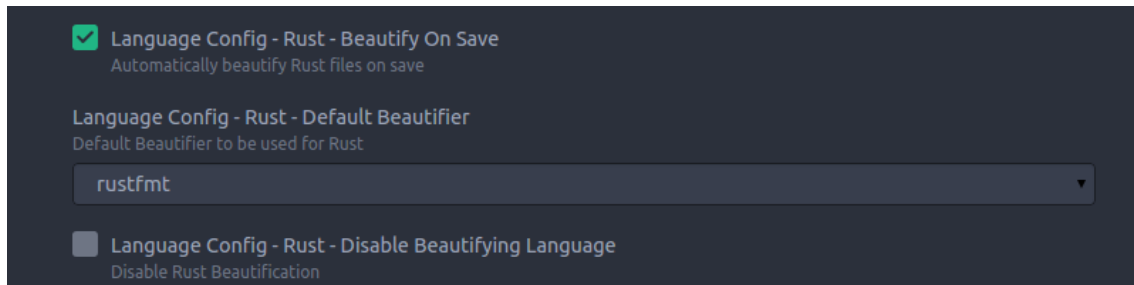

There are 2 settings that need to be configured in the atom beautifier configuration.

- Install rustfmt as per the [readme](#).
- Open the atom beautifier settings

Go to Edit->Preferences. Click the packages on the left side and click on setting for atom-beautifier

- Set rustfmt as the beautifier

Find the setting labeled *Language Config - Rust - Default Beautifier* and make sure it is set to rustfmt as shown below. You can also set the beautifier to auto format on save here.

- Set the path to your rustfmt location

Find the setting labeled *Rust - Rustfmt Path*. This setting is towards the bottom and you will need to scroll a bit. Set it to the path for your rustfmt executable.
