

Home > puppeteer > FrameWaitForFunctionOptions > polling

## FrameWaitForFunctionOptions.polling property

An interval at which the **pageFunction** is executed, defaults to **raf**. If **polling** is a number, then it is treated as an interval in milliseconds at which the function would be executed. If **polling** is a string, then it can be one of the following values:

- **raf** - to constantly execute **pageFunction** in **requestAnimationFrame** callback. This is the tightest polling mode which is suitable to observe styling changes.
- **mutation** - to execute **pageFunction** on every DOM mutation.

Signature:

```
polling?: string | number;
```
