

Benchmarks

Example sites for benchmarking `gatsby` .

Interface

The standard interface for running a benchmark is:

```
cd {benchmark directory}
export NUM_PAGES={n}
npm install
npm run build / gatsby build
```

If a specific benchmark needs to perform some code generation (e.g. `markdown_id`), that generation shall happen in a `postinstall` script. Any `postinstall` script must ensure that previous benchmark runs do not interfere with the current run.

For example:

```
"postinstall": "del-cli ./generated && gatsby clean && npm run generate"
```
