

Telemetry

Overview

`Settings.UI.Library/Telemetry` contains telemetry events generated by `Settingsv2`. These event classes are derived from the `EventBase` class and `IEvent` class. `IEvent` class provides the lowest level abstraction, containing attributes such as privacy tags needed for every telemetry data. `EventBase` class provides a higher-level abstraction, having attributes common to all `PowerToys` telemetry events.

Events

The following events are generated by `Settingsv2`: 1. `SettingsBootEvent`: This event captures the time taken by `Settingsv2` to initialize `MainWindow` UI control. 2. `SettingsEnabledEvent.cs`: This event is generated when a module is enabled or disabled.
