

So far, there is no mature Go project that does well in parsing `*.ini` files.

By comparison, we have selected an open source project: <https://github.com/go-ini/ini>.

This library helped us solve most of the key-value matching, but there are still some problems, such as not supporting parsing `map`.

We add our own logic on the basis of this library. In the current situation which, we need to complete the entire `Unmarshal` in two steps:

- Step#1, use `go-ini` to complete the basic parameter matching;
- Step#2, parse our custom parameters to realize parsing special structure, like `map`, `array`.

Some of the keywords in `tag` (like `inline`, `extends`, etc.) may be different from standard libraries such as `json` and `protobuf` in Go. For details, please refer to the library documentation: <https://ini.unknwon.io/docs/intro>.
