

Static and const variables can refer to other const variables. But a const variable cannot refer to a static variable.

Erroneous code example:

```
static X: i32 = 42;  
const Y: i32 = X;
```

In this example, `Y` cannot refer to `X`. To fix this, the value can be extracted as a const and then used:

```
const A: i32 = 42;  
static X: i32 = A;  
const Y: i32 = A;
```
