

IMPORTANT

Starting from v5, Fira Code does not distribute OTF. All packages here that have `otf-*` in the name are **now outdated** and should be replaced with ttf equivalents.

Installing with a Package Manager

Ubuntu Zesty (17.04), Debian Stretch (9) or newer

1. Make sure that the `universe` (for Ubuntu) or `contrib` (for Debian) repository is enabled (see how-to for Ubuntu or Debian docs)
2. Install `fonts-firacode` package either by executing `sudo apt install fonts-firacode` in the terminal or via GUI tool (like “Software Center”)

Arch Linux

Fira Code package is available in the official repository: `ttf-fira-code`.

Variant of Fira Code package is available in the AUR: `otf-fira-code-git`.

Gentoo

```
emerge -av media-fonts/fira-code
```

Fedora

Fira Code package is available in the official repository.

To install, perform the following command:

```
dnf install fira-code-fonts
```

Solus

```
sudo eopkg install font-firacode-ttf
```

Void linux

```
xbps-install font-firacode
```

Manual Installation

With most desktop-oriented distributions, double-clicking each font file in the `ttf` folder and selecting “Install font” should be enough. If it isn’t, create and run `download_and_install.sh` script:

```
#!/usr/bin/env bash
```

```
fonts_dir="${HOME}/.local/share/fonts"
```

```
if [ ! -d "${fonts_dir}" ]; then
    echo "mkdir -p $fonts_dir"
    mkdir -p "${fonts_dir}"
else
    echo "Found fonts dir $fonts_dir"
fi

version=5.2
zip=Fira_Code_v${version}.zip
curl --fail --location --show-error https://github.com/tonsky/FiraCode/releases/download/${version}/${zip}
unzip -o -q -d ${fonts_dir} ${zip}
rm ${zip}

echo "fc-cache -f"
fc-cache -f
```
