

Example app using nested components

Taking advantage of the composable nature of React components we can modularize our apps in self-contained, meaningful components. This example has a page under `pages/index.js` that uses

`components/paragraph.js` and `components/post.js` that can be styled and managed separately.

Deploy your own

Deploy the example using [Vercel](#) or preview live with [StackBlitz](#)

How to use

Execute `create-next-app` with [npm](#) or [Yarn](#) to bootstrap the example:

```
npx create-next-app --example nested-components nested-components-app
# or
yarn create next-app --example nested-components nested-components-app
# or
pnpm create next-app -- --example nested-components nested-components-app
```

Deploy it to the cloud with [Vercel](#) ([Documentation](#)).
