Description

The `ref:VIDIOC_G_ENC_INDEX<VIDIOC_G_ENC_INDEX>` ioctl provides meta data about a compressed video stream the same or another application currently reads from the driver, which is useful for random access into the stream without decoding it.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master][Documentation][userspace-api][media][v4l]vidioc-g-enc-index.rst, line 34); [backlink](#)

Unknown interpreted text role "ref".

To read the data applications must call `ref:VIDIOC_G_ENC_INDEX<VIDIOC_G_ENC_INDEX>` with a pointer to a struct `c:type:v4l2_enc_idx`. On success the driver fills the `entry` array, stores the number of elements written in the `entries` field, and initializes the `entries_cap` field.

Each element of the `entry` array contains meta data about one picture. A `ref`VIDIOC_G_ENC_INDEX`<VIDIOC_G_ENC_INDEX>` call reads up to `V4L2_ENC_IDX_ENTRIES` entries from a driver buffer, which can hold up to `entries_cap` entries. This number can be lower or higher than `V4L2_ENC_IDX_ENTRIES`, but not zero. When the application fails to read the meta data in time the oldest entries will be lost. When the buffer is empty or no capturing/encoding is in progress, `entries` will be zero.

Currently this ioctl is only defined for MPEG-2 program streams and video elementary streams.
