

Puppeteer class

The main Puppeteer class.

IMPORTANT: if you are using Puppeteer in a Node environment, you will get an instance of [PuppeteerNode](#) when you import or require `puppeteer`. That class extends `Puppeteer`, so has all the methods documented below as well as all that are defined on [PuppeteerNode](#).

Signature:

```
export declare class Puppeteer
```

Remarks

The constructor for this class is marked as internal. Third-party code should not call the constructor directly or create subclasses that extend the `Puppeteer` class.

Properties

Property	Modifiers	Type	Description
_changedProduct		boolean	
_isPuppeteerCore		boolean	
devices		DevicesMap	
errors		PuppeteerErrors	
networkConditions		PredefinedNetworkConditions	

Methods

Method	Modifiers	Description
clearCustomQueryHandlers()		Clears all registered handlers.
connect(options)		This method attaches Puppeteer to an existing browser instance.
customQueryHandlerNames()		
registerCustomQueryHandler(name, queryHandler)		Registers a custom query handler . After registration, the handler can be used everywhere where a selector is expected by prepending the selection string with <code><name>/. The name is only allowed to consist of lower- and upper case latin letters.</code>
unregisterCustomQueryHandler(name)
