Copying Linked Files

[gatsby-remark-copy-linked-files](#) copies files linked to from Markdown to your `public` folder.

Let's try with a PDF, that you should be able to preview and/or download by clicking this link: [Creative Commons Informational Flyer.pdf](#)

Intercepting Local Links

[gatsby-plugin-catch-links](#) intercepts local links from Markdown and other non-react pages and does a client-side `pushState` to avoid the browser having to refresh the page.

Let's try linking to the "[Code and Syntax Highlighting with PrismJS](#)" article using a relative path.

Also, let's link to "[Rendering math equations with KaTeX](#)" article using an absolute path.

And this [link will be excluded](#).
