

# Installing Version Control Tools for `go get`

The `go get` fetching of source code is done by using one of the following tools expected to be found on your system:

- **svn** - Subversion, download at: <http://subversion.apache.org/packages.html>
- **hg** - Mercurial, download at <https://www.mercurial-scm.org/downloads>
- **git** - Git, download at <http://git-scm.com/downloads>
- **bzr** - Bazaar, download at <http://wiki.bazaar.canonical.com/Download>

For example, **git** is used for Github, **hg** is used for Bitbucket, etc.

Refer [GoGetProxyConfig](#) for setting proxies for these tools.
