## General Wiki Code Style

Keeping an open wiki that everyone can edit is important to the project, and spirit of the project. However, some constancy in markdown formatting goes a long way to make the wiki look as good as it is informative.

Following these guidelines while making the readme for your plugin/theme would be recommended as well, but is not required.

---

## Headers

| GFM Element | HTML Header Tag Equivalent | Use  |
|-------------|----------------------------|--|
| #           | <h1>                       | This will not be used, as Github wiki pages uses the filename as h1                          |
| ##          | <h2>                       | Main section divider (as in this page <i>Headers</i> , <i>Syntax Highlighting</i> , etc are) |
| ### - ####  | <h3> - <h4>                | For use in subsections   |
| #####       | <h5>                       | Please try to use this just for labeling <i>Example</i> in fenced code blocks                |
| #####       | <h6>                       | For descriptors in example fenced code blocks  |

Below is an example of how to use each header (and will be the only use of ##/h2 in abnormal circumstances).

---

### This is a main subject (h2)

#### This subject has several important sub-subjects (h3)

Some sub-subjects are so vast, they require their own sub-subjects (h4)

*Example:* (h5)

**QUICK EXPLANATION OF EXAMPLE:** (H6)

---

## Tables

Tables are pretty and easy to read; please use them whenever possible for listing aliases, functions, and anything else that could possibly be made into a table.

## Syntax Highlighting

We use *shell* to highlight code blocks. GitHub-Flavor Markdown (GFM) does support highlighting `zsh` defined code blocks. However, some text editors do not, so this just makes the experience more consistent across the board.

## Line Wrapping

Do not hard wrap lines.

## Italics

Use underscores, not asterisks, to define italics. (This makes it easier to differentiate them from bold words/characters at glance in when editing.)

## Bold

Use double asterisks, not double underscores, to define bold characters or words. (This makes it easier to differentiate them from bold words/characters at glance in when editing.)

## Unnumbered lists

Use hyphens `-` for defining unnumbered lists and sublists, as opposed to asterisks.

## Images

Use Markdown formatting for images, **not HTML**.

### EXAMPLE:

```
(url to image)
```

## Line Endings

Please use Unix line ending codes and not Windows (Mac OS X uses Unix by default).

## EOF

Please leave a blank newline at the end of the file.

## Miscellaneous

Page breaks such as `---`, `____`, and `===` don't have to be used, but if so, there are no strict guidelines on using them, just don't *over use* them.
