

keychain plugin

This plugin starts automatically `keychain` to set up and load whichever credentials you want for both gpg and ssh connections.

To enable it, add `keychain` to your plugins:

```
plugins=(... keychain)
```

NOTE: It is HIGHLY recommended to also enable the `gpg-agent` plugin.

Instructions

IMPORTANT: put these settings *before* the line that sources `oh-my-zsh`

To adjust the agents that keychain manages, use the `agents` style as shown below. By default, only the `gpg` agent is managed.

```
zstyle :omz:plugins:keychain agents gpg,ssh
```

To load multiple identities use the `identities` style, For example:

```
zstyle :omz:plugins:keychain identities id_ed25519 id_github 2C5879C2
```

To pass additional options to the `keychain` program, use the `options` style; for example:

```
zstyle :omz:plugins:keychain options --quiet
```

Credits

Based on code from the `ssh-agent` plugin.
