

What's New In Python 3.5

Editors: Elvis Pranskevichus <elvis@magic.io>, Yury Selivanov <yury@magic.io>

This article explains the new features in Python 3.5, compared to 3.4. Python 3.5 was released on September 13, 2015. See the [changelog](#) for a full list of changes.

- Windows builds now use Microsoft Visual C++ 14.0, and extension modules should use the same.

Please read on for a comprehensive list of user-facing changes, including many other smaller improvements, CPython optimizations, deprecations, and potential porting issues.

New Features

PEP 492 - Coroutines with `async` and `await` syntax

[PEP 492](#) greatly improves support for asynchronous programming in Python by adding `term:'awaitable objects <awaitable>'`,

:term:`coroutine functions` <coroutine function>', :term:`asynchronous iteration` <asynchronous iterable>', and :term:`asynchronous context managers` <asynchronous context manager>'.

Coroutine functions are declared using the new `keyword: 'async def'` syntax:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.5.rst, line 176); [backlink](#)

Unknown interpreted text role "keyword".

```
>>> async def coro():
...     return 'spam'
```

Inside a coroutine function, the new `keyword: 'await'` expression can be used to suspend coroutine execution until the result is available. Any object can be *awaited*, as long as it implements the `term: 'awaitable'` protocol by defining the `meth: '__await__'` method.

PEP 492 also adds `keyword: 'async for'` statement for convenient iteration over asynchronous iterables.

An example of a rudimentary HTTP client written using the new syntax:

```
import asyncio

async def http_get(domain):
    reader, writer = await asyncio.open_connection(domain, 80)

    writer.write(b'\r\n'.join([
```

```

        b'GET / HTTP/1.1',
        b'Host: %b' % domain.encode('latin-1'),
        b'Connection: close',
        b'', b''
    )))

    async for line in reader:
        print('>>>', line)

    writer.close()

loop = asyncio.get_event_loop()
try:
    loop.run_until_complete(http_get('example.com'))
finally:
    loop.close()

```

Similarly to asynchronous iteration, there is a new syntax for asynchronous context managers. The following script:

```

import asyncio

async def coro(name, lock):
    print('coro {}: waiting for lock'.format(name))
    async with lock:
        print('coro {}: holding the lock'.format(name))
        await asyncio.sleep(1)
        print('coro {}: releasing the lock'.format(name))

loop = asyncio.get_event_loop()
lock = asyncio.Lock()
coros = asyncio.gather(coro(1, lock), coro(2, lock))
try:
    loop.run_until_complete(coros)
finally:
    loop.close()

```

will output:

```

coro 2: waiting for lock
coro 2: holding the lock
coro 1: waiting for lock
coro 2: releasing the lock
coro 1: holding the lock
coro 1: releasing the lock

```

Note that both `keyword: 'async for'` and `keyword: 'async with'` can only be used inside a coroutine function declared with `keyword: 'async def'`.

PEP 465 - A dedicated infix operator for matrix multiplication

PEP 465 adds the @ infix operator for matrix multiplication. Currently, no builtin Python types implement the new operator, however, it can be implemented by defining :meth:`__matmul__`, :meth:`__rmatmul__`, and :meth:`__imatmul__` for regular, reflected, and in-place matrix multiplication. The semantics of these methods is similar to that of methods defining other infix arithmetic operators.

Matrix multiplication is a notably common operation in many fields of mathematics, science, engineering, and the addition of @ allows writing cleaner code:

```
S = (H @ beta - r).T @ inv(H @ V @ H.T) @ (H @ beta - r)
```

instead of:

```
S = dot((dot(H, beta) - r).T,
        dot(inv(dot(dot(H, V), H.T)), dot(H, beta) - r))
```

NumPy 1.10 has support for the new operator:

```
>>> import numpy

>>> x = numpy.ones(3)
>>> x
array([ 1.,  1.,  1.])

>>> m = numpy.eye(3)
>>> m
array([[ 1.,  0.,  0.],
       [ 0.,  1.,  0.],
       [ 0.,  0.,  1.]])

>>> x @ m
array([ 1.,  1.,  1.]])
```

PEP 448 - Additional Unpacking Generalizations

PEP 448 extends the allowed uses of the `*` iterable unpacking operator and `**` dictionary unpacking operator. It is now possible to use an arbitrary number of unpackings in `ref` function calls <calls>``:

...

>>> fn(**{'a': 1, 'c': 3}, **{'b': 2, 'd': 4})

PEP 461 - percent formatting support for bytes and bytearray

PEP 461 adds support for the `%` `ref` interpolation operator <bytes-formatting>`` to `:class:`bytes`` and `:class:`bytearray``.

While interpolation is usually thought of as a string operation, there are cases where interpolation on `bytes` or `bytearrays` makes sense, and the work needed to make up for this missing functionality detracts from the overall readability of the code. This issue is particularly important when dealing with wire format protocols, which are often a mixture of binary and ASCII compatible text.

Examples:

```
>>> b'Hello %b!' % b'World'
b'Hello World!'
```

```
>>> b'x=%i y=%f' % (1, 2.5)
b'x=1 y=2.500000'
```

Unicode is not allowed for `%b`, but it is accepted by `%a` (equivalent of `repr(obj).encode('ascii', 'backslashreplace')`):

```
>>> b'Hello %b!' % 'World'
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: %b requires bytes, or an object that implements __bytes__, not 'str'
```

```
>>> b'price: %a' % '10€'
b'price: '10\u20ac''
```

Note that `%s` and `%r` conversion types, although supported, should only be used in codebases that need compatibility with Python 2.

PEP 484 - Type Hints

Function annotation syntax has been a Python feature since version 3.0 ([PEP 3107](#)), however the semantics of annotations has been left undefined.

Experience has shown that the majority of function annotation uses were to provide type hints to function parameters and return values. It became evident that it would be beneficial for Python users, if the standard library included the base definitions and tools for type annotations.

[PEP 484](#) introduces a `term` provisional module `<provisional API>` to provide these standard definitions and tools, along with some conventions for situations where annotations are not available.

Unknown interpreted text role "term".

For example, here is a simple function whose argument and return type are declared in the annotations:

```
def greeting(name: str) -> str:
    return 'Hello ' + name
```

While these annotations are available at runtime through the usual `:attr:`__annotations__`` attribute, *no automatic type checking happens at runtime*. Instead, it is assumed that a separate off-line type checker (e.g. `mypy`) will be used for on-demand source code analysis.

PEP 471 - `os.scandir()` function -- a better and faster directory iterator

PEP 471 adds a new directory iteration function, `:func:`os.scandir``, to the standard library. Additionally, `:func:`os.walk`` is now implemented using `scandir`, which makes it 3 to 5 times faster on POSIX systems and 7 to 20 times faster on Windows systems. This is largely achieved by greatly reducing the number of calls to `:func:`os.stat`` required to walk a directory tree.

Additionally, `scandir` returns an iterator, as opposed to returning a list of file names, which improves memory efficiency when iterating over very large directories.

The following example shows a simple use of `:func:`os.scandir`` to display all the files (excluding directories) in the given *path* that don't start with `'.'`. The `:meth:`entry.is_file() <os.DirEntry.is_file>` call will generally not make an additional system call:

PEP 475: Retry system calls failing with EINTR

An `py:data:errno.EINTR` error code is returned whenever a system call, that is waiting for I/O, is interrupted by a signal. Previously, Python would raise `exc:InterruptedError` in such cases. This meant that, when writing a Python application, the developer had two choices:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.5.rst, line 481); [backlink](#)

Unknown interpreted text role "py:data".

Unknown interpreted text role "exc".

1. Ignore the `InterruptedError`.
2. Handle the `InterruptedError` and attempt to restart the interrupted system call at every call site.

The first option makes an application fail intermittently. The second option adds a large amount of boilerplate that makes the code nearly unreadable. Compare:

```
print("Hello World")
```

and:

```
while True:
    try:
        print("Hello World")
        break
    except InterruptedError:
        continue
```

PEP 475 implements automatic retry of system calls on `EINTR`. This removes the burden of dealing with `EINTR` or `exc:InterruptedError` in user code in most situations and makes Python programs, including the standard library, more robust. Note that the system call is only retried if the signal handler does not raise an exception.

PEP 479: Change StopIteration handling inside generators

The interaction of generators and `:exc:'StopIteration'` in Python 3.4 and earlier was sometimes surprising, and could conceal obscure bugs. Previously, `StopIteration` raised accidentally inside a generator function was interpreted as the end of the iteration by the loop construct driving the generator.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.5.rst, line 561); [backlink](#)

Unknown interpreted text role "exc".

PEP 479 changes the behavior of generators: when a `StopIteration` exception is raised inside a generator, it is replaced with a `:exc:'RuntimeError'` before it exits the generator frame. The main goal of this change is to ease debugging in the situation where an unguarded `:func:'next'` call raises `StopIteration` and causes the iteration controlled by the generator to terminate silently. This is particularly pernicious in combination with the `yield from` construct.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.5.rst, line 567); [backlink](#)

This is a backwards incompatible change, so to enable the new behavior, a `:term:'__future__'` import is necessary:

...     yield  
...  
>>> next(gen())  
Traceback (most recent call last):  
  File "<stdin>", line 2, in gen  
StopIteration
```

The above exception was the direct cause of the following exception:

```
Traceback (most recent call last):  
  File "<stdin>", line 1, in <module>  
RuntimeError: generator raised StopIteration
```

Without a `__future__` import, a `:exc:'PendingDeprecationWarning'` will be raised whenever a `:exc:'StopIteration'` exception is raised inside a generator.

PEP 485: A function for testing approximate equality

PEP 485 adds the `func:math.isclose` and `func:cmath.isclose` functions which tell whether two values are approximately equal or "close" to each other. Whether or not two values are considered close is determined according to given absolute and relative tolerances. Relative tolerance is the maximum allowed difference between `isclose` arguments, relative to the larger absolute value:

PEP 488: Elimination of PYO files

PEP 488 does away with the concept of .pyo files. This means that .pyc files represent both unoptimized and optimized bytecode. To prevent the need to constantly regenerate bytecode files, .pyc files now have an optional `opt-` tag in their name when the bytecode is optimized. This has the side-effect of no more bytecode file name clashes when running under either `:option:`-O`` or `:option:`-OO``. Consequently, bytecode files generated from `:option:`-O``, and `:option:`-OO`` may now exist simultaneously. `:func:`importlib.util.cache_from_source`` has an updated API to help with this change.

PEP 489: Multi-phase extension module initialization

PEP 489 updates extension module initialization to take advantage of the two step module loading mechanism introduced by PEP 451 in Python 3.4.

This change brings the import semantics of extension modules that opt-in to using the new mechanism much closer to those of Python source and bytecode modules, including the ability to use any valid identifier as a module name, rather than being restricted to ASCII.

Windows builds now require Microsoft Visual C++ 14.0, which is available as part of [Visual Studio 2015](#).

Extension modules now include a platform information tag in their filename on some platforms (the tag is optional, and CPython will import extensions without it, although if the tag is present and mismatched, the extension won't be loaded):

- On Linux, extension module filenames end with `.cpython-<major><minor>m-<architecture>-<os>.pyd`:

- `<major>` is the major number of the Python version; for Python 3.5 this is 3.
- `<minor>` is the minor number of the Python version; for Python 3.5 this is 5.
- `<architecture>` is the hardware architecture the extension module was built to run on. It's most commonly either `i386` for 32-bit Intel platforms or `x86_64` for 64-bit Intel (and AMD) platforms.
- `<os>` is always `linux-gnu`, except for extensions built to talk to the 32-bit ABI on 64-bit platforms, in which case it is `linux-gnu32` (and `<architecture>` will be `x86_64`).
- On Windows, extension module filenames end with `<debug>.cp<major><minor>-<platform>.pyd`:
 - `<major>` is the major number of the Python version; for Python 3.5 this is 3.
 - `<minor>` is the minor number of the Python version; for Python 3.5 this is 5.
 - `<platform>` is the platform the extension module was built for, either `win32` for Win32, `win_amd64` for Win64, `win_i64` for Windows Itanium 64, and `win_arm` for Windows on ARM.
 - If built in debug mode, `<debug>` will be `_d`, otherwise it will be blank.
- On OS X platforms, extension module filenames now end with `-darwin.so`.
- On all other platforms, extension module filenames are the same as they were with Python 3.4.

Deprecated

New Keywords

`async` and `await` are not recommended to be used as variable, class, function or module names. Introduced by [PEP 492](#) in Python 3.5, they will become proper keywords in Python 3.7.

Deprecated Python Behavior

Raising the `:exc:'StopIteration'` exception inside a generator will now generate a silent `:exc:'PendingDeprecationWarning'`, which will become a non-silent deprecation warning in Python 3.6 and will trigger a `:exc:'RuntimeError'` in Python 3.7. See [ref: PEP 479: Change StopIteration handling inside generators <whatsnew-pep-479>](#) for details.

Porting to Python 3.5

This section lists previously described changes and other bugfixes that may require changes to your code.

Changes in Python behavior

- Due to an oversight, earlier Python versions erroneously accepted the following syntax:

```
f(1 for x in [1], *args)
f(1 for x in [1], **kwargs)
```

Python 3.5 now correctly raises a `:exc:'SyntaxError'`, as generator expressions must be put in parentheses if not a sole argument to a function.

Unknown interpreted text role "exc".

Changes in the Python API

- [PEP 475](#): System calls are now retried when interrupted by a signal instead of raising `:exc:'InterruptedError'` if the Python signal handler does not raise an exception.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.5.rst, line 2398); [backlink](#)

Unknown interpreted text role "exc".

- Before Python 3.5, a `:class:'datetime.time'` object was considered to be false if it represented midnight in UTC. This behavior was considered obscure and error-prone and has been removed in Python 3.5. See [:issue:'13936'](#) for full details.

- The `:meth:'ssl.SSLSocket.send()'` method now raises either `:exc:'ssl.SSLWantReadError'` or `:exc:'ssl.SSLWantWriteError'` on a non-blocking socket if the operation would block. Previously, it would return 0. (Contributed by Nikolaus Rath in [:issue:'20951'](#).)

- PEP 488 has removed `.pyo` files from Python and introduced the optional `opt-` tag in `.pyc` file names. The

`:func:'importlib.util.cache_from_source'` has gained an *optimization* parameter to help control the `opt-` tag. Because of this, the *debug_override* parameter of the function is now deprecated. *.pyo* files are also no longer supported as a file argument to the Python interpreter and thus serve no purpose when distributed on their own (i.e. sourceless code distribution). Due to the fact that the magic number for bytecode has changed in Python 3.5, all old *.pyo* files from previous versions of Python are invalid regardless of this PEP.

Notable changes in Python 3.5.4

New `make regen-all` build target

To simplify cross-compilation, and to ensure that CPython can reliably be compiled without requiring an existing version of Python to already be available, the autotools-based build system no longer attempts to implicitly recompile generated files based on file modification times.

Instead, a new `make regen-all` command has been added to force regeneration of these files when desired (e.g. after an initial version of Python has already been built based on the pregenerated versions).

More selective regeneration targets are also defined - see `:source:'Makefile.pre.in'` for details.
