

Home > puppeteer > Frame > select

Frame.select() method

Triggers a **change** and **input** event once all the provided options have been selected.

Signature:

```
select(selector: string, ...values: string[]): Promise<string[]>;
```

Parameters

| Parameter | Type | Description |
|-----------|----------|--|
| selector | string | a selector to query the frame for |
| values | string[] | an array of values to select. If the <code><select></code> has the <code>multiple</code> attribute, all values are considered, otherwise only the first one is taken into account. |

Returns:

Promise<string[]>

the list of values that were successfully selected.

Remarks

If there's no `<select>` element matching `selector`, the method throws an error.

Example

```
frame.select('select#colors', 'blue'); // single selection
frame.select('select#colors', 'red', 'green', 'blue'); // multiple selections
```
