

Kubectl

build unknown  reference

The `k8s.io/kubectl` repo is used to track issues for the kubectl cli distributed with `k8s.io/kubernetes`. It also contains packages intended for use by client programs. E.g. these packages are vendored into `k8s.io/kubernetes` for use in the [kubectl](#) cli client. That client will eventually move here too.

Contribution Requirements

- Full unit-test coverage.
- Go tools compliant (`go get` , `go test` , etc.). It needs to be vendorable somewhere else.
- No dependence on `k8s.io/kubernetes` . Dependence on other repositories is fine.
- Code must be usefully [commented](#). Not only for developers on the project, but also for external users of these packages.
- When reviewing PRs, you are encouraged to use Golang's [code review comments](#) page.
- Packages in this repository should aspire to implement sensible, small interfaces and import a limited set of dependencies.

Community, discussion, contribution, and support

See [this document](#) for how to reach the maintainers of this project.

Code of conduct

Participation in the Kubernetes community is governed by the [Kubernetes Code of Conduct](#).
