

## zh-CN

默认情况下 `onChange` 里只能拿到 `value`，如果需要拿到选中的节点文本 `label`，可以使用 `labelInValue` 属性。

选中项的 `label` 会被包装到 `value` 中传递给 `onChange` 等函数，此时 `value` 是一个对象。

## en-US

As a default behavior, the `onChange` callback can only get the `value` of the selected item. The `labelInValue` prop can be used to get the `label` property of the selected item.

The `label` of the selected item will be packed as an object for passing to the `onChange` callback.

```
import { Select } from 'antd';

const { Option } = Select;

function handleChange(value) {
  console.log(value); // { value: "lucy", key: "lucy", label: "Lucy (101)" }
}

export default () => (
  <Select
    labelInValue
    defaultValue={{ value: 'lucy' }}
    style={{ width: 120 }}
    onChange={handleChange}
  >
    <Option value="jack">Jack (100)</Option>
    <Option value="lucy">Lucy (101)</Option>
  </Select>
);
```
