   The :mod:`msilib` module is deprecated (see :pep:`594` for details).
```

The `:mod:`msilib`` supports the creation of Microsoft Installer (`.msi`) files. Because these files often contain an embedded "cabinet" file (`.cab`), it also exposes an API to create CAB files. Support for reading `.cab` files is currently not implemented; read support for the `.msi` database is possible.

This package aims to provide complete access to all tables in an `.msi` file, therefore, it is a fairly low-level API. One primary application of this package is the creation of Python installer package itself (although that currently uses a different version of `msilib`).

The package contents can be roughly split into four parts: low-level CAB routines, low-level MSI routines, higher-level MSI routines, and standard table structures.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-

main\Doc\library\ [cpython-main] [Doc] [library]msilib.rst, line 36)

Unknown directive type "function".

```
.. function:: FCICreate(cabname, files)
```

Create a new CAB file named **cabname**. **files** must be a list of tuples, each containing the name of the file on disk, and the name of the file inside the CAB file.

The files are added to the CAB file in the order they appear in the list. All files are added into a single CAB file, using the MSZIP compression algorithm.

Callbacks to Python for the various steps of MSI creation are currently not exposed.

.. function:: UuidCreate()
```

Return the string representation of a new unique identifier. This wraps the Windows API functions `:c:func:`UuidCreate`` and `:c:func:`UuidToString``.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]msilib.rst, line 55)

Unknown directive type "function".

```
.. function:: OpenDatabase(path, persist)
```

Return a new database object by calling `MsiOpenDatabase`. **path** is the file name of the MSI file; **persist** can be one of the constants ```MSIDBOPEN_CREATEDIRECT```, ```MSIDBOPEN_CREATE```, ```MSIDBOPEN_DIRECT```, ```MSIDBOPEN_READONLY```, or ```MSIDBOPEN_TRANSACT```, and may include the flag ```MSIDBOPEN_PATCHFILE```. See the Microsoft documentation for the meaning of these flags; depending on the flags, an existing database is opened, or a new one created.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]msilib.rst, line 66)

Unknown directive type "function".

```
.. function:: CreateRecord(count)
```

Return a new record object by calling `:c:func:`MSICreateRecord``. **count** is the number of fields of the record.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]msilib.rst, line 72)

Unknown directive type "function".

```
.. function:: init_database(name, schema, ProductName, ProductCode, ProductVersion, Manufacturer)
```

Create and return a new database **name**, initialize it with **schema**, and set the properties **ProductName**, **ProductCode**, **ProductVersion**, and **Manufacturer**.

schema must be a module object containing ```tables``` and ```_Validation_records``` attributes; typically, `:mod:`msilib.schema`` should be used.

The database will contain just the schema and the validation records when this function returns.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]msilib.rst, line 86)

Unknown directive type "function".

```
.. function:: add_data(database, table, records)
```

Add all **records** to the table named **table** in **database**.

The **table** argument must be one of the predefined tables in the MSI schema, e.g. ```'Feature'```, ```'File'```, ```'Component'```, ```'Dialog'```, ```'Control'```, etc.

records should be a list of tuples, each one containing all fields of a record according to the schema of the table. For optional fields, ```None``` can be passed.

Field values can be ints, strings, or instances of the Binary class.

Represents entries in the Binary table; inserting such an object using `:func:'add_data'` reads the file named *filename* into the table.

Directory Objects

Create a new directory in the Directory table. There is a current component at each point in time for the directory, which is either explicitly created through `meth: start_component`, or implicitly when files are added for the first time. Files are added into the current component, and into the cab file. To create a directory, a base directory object needs to be specified (can be `None`), the path to the physical directory, and a logical directory name. *default* specifies the DefaultDir slot in the directory table. *componentflags* specifies the default flags that new components get.

```
.. method:: add(name, x, y, width, height, text, value=None)
```

Add a radio button named **name** to the group, at the coordinates **x**, **y**, **width**, **height**, and with the label **text**. If **value** is ``None``, it defaults to **name**.

Return a new `:class:`Dialog`` object. An entry in the `Dialog` table is made, with the specified coordinates, dialog attributes, title, name of the first, default, and cancel controls.

```
.. method:: control(name, type, x, y, width, height, attributes, property, text, control_next, help)
```

Return a new `:class:`Control`` object. An entry in the ``Control`` table is made with the specified parameters.

This is a generic method; for specific types, specialized methods are provided.

Precomputed tables

`mod:msilib` provides a few subpackages that contain only schema and table definitions. Currently, these definitions are based on MSI version 2.0.

```
.. data:: schema

    This is the standard MSI schema for MSI 2.0, with the *tables* variable
    providing a list of table definitions, and *_Validation_records* providing the
    data for MSI validation.
