

By default this block is setup to scrape logs from `/var/logs`. If you need to log some service from the docker-compse you can add:

```
# For this to work you need to install the logging driver see https://github.com/grafana
logging:
  driver: loki
  options:
    loki-url: "http://loki:3100/loki/api/v1/push"
```

This also works for self logging Loki logs if you use `http://localhost:3100/loki/api/v1/push`. This is useful together with

```
environment:
  - JAEGER_AGENT_HOST=tempo
  - JAEGER_AGENT_PORT=6831
  - JAEGER_SAMPLER_TYPE=const
  - JAEGER_SAMPLER_PARAM=1
```

which sets up a tracing and so you will have logs with traceIDs to test linking between logs and traces.
