

Preact example

This example uses [Preact](#) instead of React. It's a React like UI framework which is fast and small.

Deploy your own

Deploy the example using [Vercel](#) or preview live with [StackBlitz](#)

How to use

Execute [create-next-app](#) with [npm](#) or [Yarn](#) to bootstrap the example:

```
npx create-next-app --example using-preact using-preact-app
# or
yarn create next-app --example using-preact using-preact-app
# or
pnpm create next-app -- --example using-preact using-preact-app
```

Deploy it to the cloud with [Vercel \(Documentation\)](#).

Aliasing react -> preact

Using `preact` with `next.js` depends on aliasing react packages to preact ones (like `@preact/compat`). This is done directly in the [package.json](#) dependencies.

next-plugin-preact

This example was [updated](#) to use [next-plugin-preact](#) and now requires minimal configuration, if you want to add preact without a plugin, or see how it works, head to the previous [next.config.js](#).
