

-a, -auto *us*

Set the automatic trace mode. This mode sets some commonly used options while debugging the system. It is equivalent to use **-T** *us* **-s** *us* **-t**. By default, *timerlat* tracer uses FIFO:95 for *timerlat* threads, thus equivalent to **-P** *f:95*.

-p, -period *us*

Set the *timerlat* tracer period in microseconds.

-i, -irq *us*

Stop trace if the *IRQ* latency is higher than the argument in us.

-T, -thread *us*

Stop trace if the *Thread* latency is higher than the argument in us.

-s, -stack *us*

Save the stack trace at the *IRQ* if a *Thread* latency is higher than the argument in us.

-dma-latency *us*

Set the `/dev/cpu_dma_latency` to *us*, aiming to bound exit from idle latencies. *cyclictst* sets this value to 0 by default, use **-dma-latency** 0 to have similar results.
