

dbus

dbus is a simple library that implements native Go client bindings for the D-Bus message bus system.

Features

- Complete native implementation of the D-Bus message protocol
- Go-like API (channels for signals / asynchronous method calls, Goroutine-safe connections)
- Subpackages that help with the introspection / property interfaces

Installation

This packages requires Go 1.12 or later. It can be installed by running the command below:

```
go get github.com/godbus/dbus/v5
```

Usage

The complete package documentation and some simple examples are available at godoc.org. Also, the [examples](#) directory gives a short overview over the basic usage.

Projects using godbus

- [fyne](#) a cross platform GUI in Go inspired by Material Design.
- [fynedesk](#) a full desktop environment for Linux/Unix using Fyne.
- [go-bluetooth](#) provides a bluetooth client over bluez dbus API.
- [iwd](#) go bindings for the internet wireless daemon "iwd".
- [notify](#) provides desktop notifications over dbus into a library.
- [playerbm](#) a bookmark utility for media players.

Please note that the API is considered unstable for now and may change without further notice.
