

# Detailed Colorspace Descriptions

## Colorspace SMPTE 170M (V4L2\_COLORSPACE\_SMPTE170M)

The `ref:smp170m` standard defines the colorspace used by NTSC and PAL and by SDTV in general. The default transfer function is `V4L2_XFER_FUNC_709`. The default Y'CbCr encoding is `V4L2_YCBCR_ENC_601`. The default Y'CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 13); [backlink](#)

Unknown interpreted text role "ref".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 20)

Unknown directive type "flat-table".

```
.. flat-table:: SMPTE 170M Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths:      1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.630
     - 0.340
   * - Green
     - 0.310
     - 0.595
   * - Blue
     - 0.155
     - 0.070
   * - White Reference (D65)
     - 0.3127
     - 0.3290
```

The red, green and blue chromaticities are also often referred to as the SMPTE C set, so this colorspace is sometimes called SMPTE C as well.

The transfer function defined for SMPTE 170M is the same as the one defined in Rec. 709.

$$L' = -1.099(-L)^{0.45} + 0.099, \text{ for } L \leq -0.018$$

$$L' = 4.5L, \text{ for } -0.018 < L < 0.018$$

$$L' = 1.099L^{0.45} - 0.099, \text{ for } L \geq 0.018$$

Inverse Transfer function:

$$L = -\frac{L' - 0.099}{1.099}^{\frac{1}{0.45}}, \text{ for } L' \leq -0.081$$

$$L = \frac{L'}{4.5}, \text{ for } -0.081 < L' < 0.081$$

$$L = \frac{L' + 0.099}{1.099}^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081$$

The luminance (Y') and color difference (Cb and Cr) are obtained with the following `V4L2_YCBCR_ENC_601` encoding:

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1687R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4187G' - 0.0813B'$$

Y' is clamped to the range [0â€¦1] and Cb and Cr are clamped to the range [-0.5â€¦0.5]. This conversion to Y'CbCr is identical to the one defined in the [ref`itu601`](#) standard and this colorspace is sometimes called BT.601 as well, even though BT.601 does not mention any color primaries.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 77); [backlink](#)

Unknown interpreted text role "ref".

The default quantization is limited range, but full range is possible although rarely seen.

## Colorspace Rec. 709 (V4L2\_COLORSPACE\_REC709)

The [ref`itu709`](#) standard defines the colorspace used by HDTV in general. The default transfer function is V4L2\_XFER\_FUNC\_709. The default Y'CbCr encoding is V4L2\_YCBCR\_ENC\_709. The default Y'CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 91); [backlink](#)

Unknown interpreted text role "ref".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 97)

Unknown directive type "flat-table".

```
.. flat-table:: Rec. 709 Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths:      1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.640
     - 0.330
   * - Green
     - 0.300
     - 0.600
   * - Blue
     - 0.150
     - 0.060
   * - White Reference (D65)
     - 0.3127
     - 0.3290
```

The full name of this standard is Rec. ITU-R BT.709-5.

Transfer function. Normally L is in the range [0â€¦1], but for the extended gamut xvYCC encoding values outside that range are allowed.

$$L' = -1.099(-L)^{0.45} + 0.099, \text{ for } L \leq -0.018$$

$$L' = 4.5L, \text{ for } -0.018 < L < 0.018$$

$$L' = 1.099L^{0.45} - 0.099, \text{ for } L \geq 0.018$$

Inverse Transfer function:

$$L = -\frac{L' - 0.099}{1.099} \frac{1}{0.45}, \text{ for } L' \leq -0.081$$

$$L = \frac{L'}{4.5}, \text{ for } -0.081 < L' < 0.081$$

$$L = \frac{L' + 0.099}{1.099} \frac{1}{0.45}, \text{ for } L' \geq 0.081$$

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2\_YCBCR\_ENC\_709 encoding:

$$Y' = 0.2126R' + 0.7152G' + 0.0722B'$$

$$Cb = -0.1146R' - 0.3854G' + 0.5B'$$

$$Cr = 0.5R' - 0.4542G' - 0.0458B'$$

Y' is clamped to the range [0â€¦1] and Cb and Cr are clamped to the range [-0.5â€¦0.5].

The default quantization is limited range, but full range is possible although rarely seen.

The V4L2\_YCBCR\_ENC\_709 encoding described above is the default for this colorspace, but it can be overridden with V4L2\_YCBCR\_ENC\_601, in which case the BT.601 Y'CbCr encoding is used.

Two additional extended gamut Y'CbCr encodings are also possible with this colorspace:

The xvYCC 709 encoding (V4L2\_YCBCR\_ENC\_XV709, [ref:xyycc'](#)) is similar to the Rec. 709 encoding, but it allows for R', G' and B' values that are outside the range [0â€¦1]. The resulting Y', Cb and Cr values are scaled and offset according to the limited range formula:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 166); [backlink](#)

Unknown interpreted text role "ref".

$$Y' = \frac{219}{256} * (0.2126R' + 0.7152G' + 0.0722B') + \frac{16}{256}$$

$$Cb = \frac{224}{256} * (-0.1146R' - 0.3854G' + 0.5B')$$

$$Cr = \frac{224}{256} * (0.5R' - 0.4542G' - 0.0458B')$$

The xvYCC 601 encoding (V4L2\_YCBCR\_ENC\_XV601, [ref:xyycc'](#)) is similar to the BT.601 encoding, but it allows for R', G' and B' values that are outside the range [0â€¦1]. The resulting Y', Cb and Cr values are scaled and offset according to the limited range formula:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 179); [backlink](#)

Unknown interpreted text role "ref".

$$Y' = \frac{219}{256} * (0.2990R' + 0.5870G' + 0.1140B') + \frac{16}{256}$$

$$Cb = \frac{224}{256} * (-0.1687R' - 0.3313G' + 0.5B')$$

$$Cr = \frac{224}{256} * (0.5R' - 0.4187G' - 0.0813B')$$

Y' is clamped to the range [0â€¦1] and Cb and Cr are clamped to the range [-0.5â€¦0.5] and quantized without further scaling or

offsets. The non-standard xvYCC 709 or xvYCC 601 encodings can be used by selecting V4L2\_YCBCR\_ENC\_XV709 or V4L2\_YCBCR\_ENC\_XV601. As seen by the xvYCC formulas these encodings always use limited range quantization, there is no full range variant. The whole point of these extended gamut encodings is that values outside the limited range are still valid, although they map to R', G' and B' values outside the [0â€¦1] range and are therefore outside the Rec. 709 colorspace gamut.

## Colorspace sRGB (V4L2\_COLORSPACE\_SRGB)

The `ref:srgb` standard defines the colorspace used by most webcams and computer graphics. The default transfer function is V4L2\_XFER\_FUNC\_SRGB. The default YCbCr encoding is V4L2\_YCBCR\_ENC\_601. The default YCbCr quantization is limited range.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 208); [backlink](#)**

Unknown interpreted text role "ref".

Note that the `ref:sycc` standard specifies full range quantization, however all current capture hardware supported by the kernel convert R'G'B' to limited range YCbCr. So choosing full range as the default would break how applications interpret the quantization range.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 213); [backlink](#)**

Unknown interpreted text role "ref".

The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 220)**

Unknown directive type "flat-table".

```
.. flat-table:: sRGB Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths: 1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.640
     - 0.330
   * - Green
     - 0.300
     - 0.600
   * - Blue
     - 0.150
     - 0.060
   * - White Reference (D65)
     - 0.3127
     - 0.3290
```

These chromaticities are identical to the Rec. 709 colorspace.

Transfer function. Note that negative values for L are only used by the YCbCr conversion.

$$L' = -1.055(-L)^{\frac{1}{2.4}} + 0.055, \text{ for } L < -0.0031308$$

$$L' = 12.92L, \text{ for } -0.0031308 \leq L \leq 0.0031308$$

$$L' = 1.055L^{\frac{1}{2.4}} - 0.055, \text{ for } 0.0031308 < L \leq 1$$

Inverse Transfer function:

$$L = -((-L' + 0.055)/1.055)^{2.4}, \text{ for } L' < -0.04045$$

$$L = L' / 12.92, \text{ for } -0.04045 \leq L' \leq 0.04045$$

$$L = ((L' + 0.055)/1.055)^{2.4}, \text{ for } L' > 0.04045$$

The luminance ( $Y'$ ) and color difference ( $Cb$  and  $Cr$ ) are obtained with the following V4L2\_YCBCR\_ENC\_601 encoding as defined in `ref`sycc``:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 265); [backlink](#)

Unknown interpreted text role "ref".

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1687R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4187G' - 0.0813B'$$

$Y'$  is clamped to the range  $[0 \leq 1]$  and  $Cb$  and  $Cr$  are clamped to the range  $[-0.5 \leq 0.5]$ . This transform is identical to one defined in SMPTE 170M/BT.601. The  $Y'CbCr$  quantization is limited range.

## Colorspace opRGB (V4L2\_COLORSPACE\_OPRGB)

The `ref`oprgb`` standard defines the colorspace used by computer graphics that use the opRGB colorspace. The default transfer function is V4L2\_XFER\_FUNC\_OPRGB. The default  $Y'CbCr$  encoding is V4L2\_YCBCR\_ENC\_601. The default  $Y'CbCr$  quantization is limited range.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 286); [backlink](#)

Unknown interpreted text role "ref".

Note that the `ref`oprgb`` standard specifies full range quantization, however all current capture hardware supported by the kernel convert R'G'B' to limited range  $Y'CbCr$ . So choosing full range as the default would break how applications interpret the quantization range.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 292); [backlink](#)

Unknown interpreted text role "ref".

The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 299)

Unknown directive type "flat-table".

```
.. flat-table:: opRGB Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths:      1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.6400
     - 0.3300
   * - Green
     - 0.2100
     - 0.7100
```

- \* - Blue
  - 0.1500
  - 0.0600
- \* - White Reference (D65)
  - 0.3127
  - 0.3290

Transfer function:

$$L' = L^{\frac{1}{2.19921875}}$$

Inverse Transfer function:

$$L = L'^{(2.19921875)}$$

The luminance ( $Y'$ ) and color difference ( $Cb$  and  $Cr$ ) are obtained with the following V4L2\_YCBCR\_ENC\_601 encoding:

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1687R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4187G' - 0.0813B'$$

$Y'$  is clamped to the range  $[0\hat{e}1]$  and  $Cb$  and  $Cr$  are clamped to the range  $[-0.5\hat{e}0.5]$ . This transform is identical to one defined in SMPTE 170M/BT.601. The Y'CbCr quantization is limited range.

## Colorspace BT.2020 (V4L2\_COLORSPACE\_BT2020)

The `ref:itu2020` standard defines the colorspace used by Ultra-high definition television (UHDTV). The default transfer function is V4L2\_XFER\_FUNC\_709. The default Y'CbCr encoding is V4L2\_YCBCR\_ENC\_BT2020. The default Y'CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 355); [backlink](#)**

Unknown interpreted text role "ref".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 361)**

Unknown directive type "flat-table".

```
.. flat-table:: BT.2020 Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths: 1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.708
     - 0.292
   * - Green
     - 0.170
     - 0.797
   * - Blue
     - 0.131
     - 0.046
   * - White Reference (D65)
     - 0.3127
     - 0.3290
```

Transfer function (same as Rec. 709):

$$L' = 4.5L, \text{ for } 0 \leq L < 0.018$$

$$L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1$$

Inverse Transfer function:

$$L = L' / 4.5, \text{ for } L' < 0.081$$

$$L = \frac{L' + 0.099}{1.099^{1/0.45}}, \text{ for } L' \geq 0.081$$

Please note that while Rec. 709 is defined as the default transfer function by the [ITU2020](#) standard, in practice this colorspace is often used with the [xf-smpte-2084](#). In particular Ultra HD Blu-ray discs use this combination.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 400); [backlink](#)

Unknown interpreted text role "ref".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 400); [backlink](#)

Unknown interpreted text role "ref".

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2\_YCBCR\_ENC\_BT2020 encoding:

$$Y' = 0.2627R' + 0.6780G' + 0.0593B'$$

$$Cb = -0.1396R' - 0.3604G' + 0.5B'$$

$$Cr = 0.5R' - 0.4598G' - 0.0402B'$$

Y' is clamped to the range [0â€¦1] and Cb and Cr are clamped to the range [-0.5â€¦0.5]. The Y'CbCr quantization is limited range.

There is also an alternate constant luminance R'G'B' to Yc'CbCrc (V4L2\_YCBCR\_ENC\_BT2020\_CONST\_LUM) encoding:

Luma:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 424)

Error in "math" directive: unknown option: "nowrap".

```
.. math::
    :nowrap:

    \begin{align*}
    Yc' &= (0.2627R + 0.6780G + 0.0593B) ' & \backslash \\
    B' - Yc' &\leq 0: & \backslash \\
    &\quad \& Cbc = (B' - Yc') / 1.9404 \backslash \\
    B' - Yc' > 0: & \backslash \\
    &\quad \& Cbc = (B' - Yc') / 1.5816 \backslash \\
    R' - Yc' &\leq 0: & \backslash \\
    &\quad \& Crc = (R' - Y') / 1.7184 \backslash \\
    R' - Yc' > 0: & \backslash \\
    &\quad \& Crc = (R' - Y') / 0.9936 \\
    \end{align*}
```

Yc' is clamped to the range [0â€¦1] and Cbc and Crc are clamped to the range [-0.5â€¦0.5]. The Yc'CbCrc quantization is limited range.

## Colorspace DCI-P3 (V4L2\_COLORSPACE\_DCI\_P3)

The `ref:smp431` standard defines the colorspace used by cinema projectors that use the DCI-P3 colorspace. The default transfer function is `V4L2_XFER_FUNC_DCI_P3`. The default YCbCr encoding is `V4L2_YCBCR_ENC_709`. The default YCbCr quantization is limited range.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 448); [backlink](#)

Unknown interpreted text role "ref".

#### Note

Note that this colorspace standard does not specify a YCbCr encoding since it is not meant to be encoded to YCbCr. So this default YCbCr encoding was picked because it is the HDTV encoding.

The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 462)

Unknown directive type "flat-table".

```
.. flat-table:: DCI-P3 Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths:      1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.6800
     - 0.3200
   * - Green
     - 0.2650
     - 0.6900
   * - Blue
     - 0.1500
     - 0.0600
   * - White Reference
     - 0.3140
     - 0.3510
```

Transfer function:

$$L' = L_{2.6}^{\frac{1}{2.6}}$$

Inverse Transfer function:

$$L = L'^{(2.6)}$$

YCbCr encoding is not specified. V4L2 defaults to Rec. 709.

## Colorspace SMPTE 240M (V4L2\_COLORSPACE\_SMPTE240M)

The `ref:smp240m` standard was an interim standard used during the early days of HDTV (1988-1998). It has been superseded by Rec. 709. The default transfer function is `V4L2_XFER_FUNC_SMPTE240M`. The default YCbCr encoding is `V4L2_YCBCR_ENC_SMPTE240M`. The default YCbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 505); [backlink](#)

Unknown interpreted text role "ref".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 513)**

Unknown directive type "flat-table".

```
.. flat-table:: SMPTE 240M Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths:      1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.630
     - 0.340
   * - Green
     - 0.310
     - 0.595
   * - Blue
     - 0.155
     - 0.070
   * - White Reference (D65)
     - 0.3127
     - 0.3290
```

These chromaticities are identical to the SMPTE 170M colorspace.

Transfer function:

$$L' = 4L, \text{ for } 0 \leq L < 0.0228$$

$$L' = 1.1115L^{0.45} - 0.1115, \text{ for } 0.0228 \leq L \leq 1$$

Inverse Transfer function:

$$L = \frac{L'}{4}, \text{ for } 0 \leq L' < 0.0913$$

$$L = \frac{L' + 0.1115}{1.1115}, \text{ for } L' \geq 0.0913$$

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2\_YCBCR\_ENC\_SMPTE240M encoding:

$$Y' = 0.2122R' + 0.7013G' + 0.0865B'$$

$$Cb = -0.1161R' - 0.3839G' + 0.5B'$$

$$Cr = 0.5R' - 0.4451G' - 0.0549B'$$

Y' is clamped to the range [0,1] and Cb and Cr are clamped to the range [-0.5,0.5]. The Y'CbCr quantization is limited range.

## Colorspace NTSC 1953 (V4L2\_COLORSPACE\_470\_SYSTEM\_M)

This standard defines the colorspace used by NTSC in 1953. In practice this colorspace is obsolete and SMPTE 170M should be used instead. The default transfer function is V4L2\_XFER\_FUNC\_709. The default Y'CbCr encoding is V4L2\_YCBCR\_ENC\_601. The default Y'CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 581)**

Unknown directive type "flat-table".

```
.. flat-table:: NTSC 1953 Chromaticities

   :stub-columns: 0
   :widths:      1 1 2
```

- \* - Color
  - x
  - y
- \* - Red
  - 0.67
  - 0.33
- \* - Green
  - 0.21
  - 0.71
- \* - Blue
  - 0.14
  - 0.08
- \* - White Reference (C)
  - 0.310
  - 0.316

#### Note

This colorspace uses Illuminant C instead of D65 as the white reference. To correctly convert an image in this colorspace to another that uses D65 you need to apply a chromatic adaptation algorithm such as the Bradford method.

The transfer function was never properly defined for NTSC 1953. The Rec. 709 transfer function is recommended in the literature:

$$L' = 4.5L, \text{ for } 0 \leq L < 0.018$$

$$L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1$$

Inverse Transfer function:

$$L = \frac{L'}{4.5}, \text{ for } L' < 0.081$$

$$L = \frac{L' + 0.099}{1.099}, \text{ for } L' \geq 0.081$$

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2\_YCBCR\_ENC\_601 encoding:

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1687R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4187G' - 0.0813B'$$

Y' is clamped to the range [0â€¦1] and Cb and Cr are clamped to the range [-0.5â€¦0.5]. The Y'CbCr quantization is limited range. This transform is identical to one defined in SMPTE 170M/BT.601.

### Colorspace EBU Tech. 3213 (V4L2\_COLORSPACE\_470\_SYSTEM\_BG)

The [ref`tech3213`](#) standard defines the colorspace used by PAL/SECAM in 1975. Note that this colorspace is not supported by the HDMI interface. Instead [ref`tech3321`](#) recommends that Rec. 709 is used instead for HDMI. The default transfer function is V4L2\_XFER\_FUNC\_709. The default Y'CbCr encoding is V4L2\_YCBCR\_ENC\_601. The default Y'CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspace-details.rst, line 648); [backlink](#)**

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 658)**

Unknown directive type "flat-table".

```
.. flat-table:: EBU Tech. 3213 Chromaticities
   :header-rows: 1
   :stub-columns: 0
   :widths:      1 1 2

   * - Color
     - x
     - y
   * - Red
     - 0.64
     - 0.33
   * - Green
     - 0.29
     - 0.60
   * - Blue
     - 0.15
     - 0.06
   * - White Reference (D65)
     - 0.3127
     - 0.3290
```

The transfer function was never properly defined for this colorspace. The Rec. 709 transfer function is recommended in the literature:

$$L' = 4.5L, \text{ for } 0 \leq L < 0.018$$

$$L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1$$

Inverse Transfer function:

$$L = \frac{L'}{4.5}, \text{ for } L' < 0.081$$

$$L = \frac{L' + 0.099}{1.099}, \text{ for } L' \geq 0.081$$

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2\_YCBCR\_ENC\_601 encoding:

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1687R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4187G' - 0.0813B'$$

Y' is clamped to the range [0â€¦1] and Cb and Cr are clamped to the range [-0.5â€¦0.5]. The Y'CbCr quantization is limited range. This transform is identical to one defined in SMPTE 170M/BT.601.

## Colorspace JPEG (V4L2\_COLORSPACE\_JPEG)

This colorspace defines the colorspace used by most (Motion-)JPEG formats. The chromaticities of the primary colors and the white reference are identical to sRGB. The transfer function use is V4L2\_XFER\_FUNC\_SRGB. The Y'CbCr encoding is V4L2\_YCBCR\_ENC\_601 with full range quantization where Y' is scaled to [0â€¦255] and Cb/Cr are scaled to [-128â€¦128] and then clipped to [-128â€¦127].

### Note

The JPEG standard does not actually store colorspace information. So if something other than sRGB is used, then the driver will have to set that information explicitly. Effectively V4L2\_COLORSPACE\_JPEG can be considered to be an abbreviation for V4L2\_COLORSPACE\_SRGB, V4L2\_XFER\_FUNC\_SRGB, V4L2\_YCBCR\_ENC\_601 and V4L2\_QUANTIZATION\_FULL\_RANGE.

# Detailed Transfer Function Descriptions

## Transfer Function SMPTE 2084 (V4L2\_XFER\_FUNC\_SMPTE2084)

The `ref:smp2084` standard defines the transfer function used by High Dynamic Range content.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 744); [backlink](#)

Unknown interpreted text role 'ref'.

Constants:

$$\begin{aligned}m1 &= (2610 / 4096) / 4 \\m2 &= (2523 / 4096) * 128 \\c1 &= 3424 / 4096 \\c2 &= (2413 / 4096) * 32 \\c3 &= (2392 / 4096) * 32\end{aligned}$$

Transfer function:

$$L' = ((c1 + c2 * L^{m1}) / (1 + c3 * L^{m1}))^{m2}$$

Inverse Transfer function:

$$L = (\max(L'^{1/m2} - c1, 0) / (c2 - c3 * L'^{1/m2}))^{1/m1}$$

Take care when converting between this transfer function and non-HDR transfer functions: the linear RGB values  $[0\hat{c}1]$  of HDR content map to a luminance range of 0 to 10000 cd/m<sup>2</sup> whereas the linear RGB values of non-HDR (aka Standard Dynamic Range or SDR) map to a luminance range of 0 to 100 cd/m<sup>2</sup>.

To go from SDR to HDR you will have to divide L by 100 first. To go in the other direction you will have to multiply L by 100. Of course, this clamps all luminance values over 100 cd/m<sup>2</sup> to 100 cd/m<sup>2</sup>.

There are better methods, see e.g. `ref:colimg` for more in-depth information about this.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v4l\linux-master) (Documentation) (userspace-api) (media) (v4l) colorspaces-details.rst, line 774); [backlink](#)
