

Static Analysis

The project uses Coverity to scan Node.js source code and to report potential issues in the C/C++ code base.

Those who have been added to the Node.js coverity project can receive emails when there are new issues reported as well as view all current issues through <https://scan9.coverity.com/reports.htm>.

Any collaborator can ask to be added to the Node.js coverity project by opening an issue in the [build](#) repository titled `Please add me to coverity`. A member of the build WG with admin access will verify that the requestor is an existing collaborator as listed in the [collaborators section](#) on the nodejs/node project repo. Once validated the requestor will be added to the coverity project.
