

iTerm2 plugin

This plugin adds a few functions that are useful when using iTerm2.

To use it, add *iterm2* to the plugins array of your zshrc file:

```
plugins=(... iterm2)
```

Plugin commands

- `_iterm2_command <iterm2-command>` executes an arbitrary iTerm2 command via an escape code sequence. See <https://iterm2.com/documentation-escape-codes.html> for all supported commands.
- `iterm2_profile <profile-name>` changes the current terminal window's profile (colors, fonts, settings, etc). `profile-name` is the name of another iTerm2 profile. The profile name can contain spaces.
- `iterm2_tab_color <red> <green> <blue>` changes the color of iTerm2's currently active tab. `red/green/blue` are on the range 0-255.
- `iterm2_tab_color_reset` resets the color of iTerm2's current tab back to default.
