

Unstyled table pagination

Table pagination lets users navigate through data in tables.

```
{{"component": "modules/components/ComponentLinkHeader.js", "design": false}}
```

The `TablePaginationUnstyled` component controls two table properties: displayed page index and number of rows per page.

By default it renders its internal components wrapped in a `tr` tag, so it's easy to insert it in a table's `tr`. This can be changed, if needed, by supplying the `component` or `components.Root` prop. This way you can place the pagination controls outside of the table.

Basic TablePaginationUnstyled

```

Custom pagination options

It's possible to customize the options shown in the "Rows per page" select using the `rowsPerPageOptions` prop. You should either provide an array of:

- **numbers**, each number will be used for the option's label and value.

```
<TablePaginationUnstyled rowsPerPageOptions={[10, 50]} />
```

- **objects**, the `value` and `label` keys will be used respectively for the value and label of the option (useful for words such as "All").

```
<TablePaginationUnstyled  
  rowsPerPageOptions={[10, 50, { value: -1, label: 'All' }]}  
/>
```

Customized look and feel
