

:mod:`posix` --- The most common POSIX system calls

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 1); [backlink](#)

Unknown interpreted text role "mod".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 4)

Unknown directive type "module".

```
.. module:: posix
   :platform: Unix
   :synopsis: The most common POSIX system calls (normally used via module os).
```

This module provides access to operating system functionality that is standardized by the C Standard and the POSIX standard (a thinly disguised Unix interface).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 14)

Unknown directive type "index".

```
.. index:: module: os
```

Do not import this module directly. Instead, import the module `:mod:`os``, which provides a *portable* version of this interface. On Unix, the `:mod:`os`` module provides a superset of the `:mod:`posix`` interface. On non-Unix operating systems the `:mod:`posix`` module is not available, but a subset is always available through the `:mod:`os`` interface. Once `:mod:`os`` is imported, there is *no* performance penalty in using it instead of `:mod:`posix``. In addition, `:mod:`os`` provides some additional functionality, such as automatically calling `:func:`~os.putenv`` when an entry in `os.environ` is changed.

Errors are reported as exceptions; the usual exceptions are given for type errors, while errors reported by the system calls raise `exc: OSError`.

```

Several operating systems (including AIX, HP-UX and Solaris) provide support for files that are larger than 2 GiB from a C programming model where `:c:type:'int'` and `:c:type:'long'` are 32-bit values. This is typically accomplished by defining the relevant size and offset types as 64-bit values. Such files are sometimes referred to as `:dfn:'large files'`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 40); [backlink](#)

Unknown interpreted text role "dfn".

Large file support is enabled in Python when the size of an `:c:type:'off_t'` is larger than a `:c:type:'long'` and the `:c:type:'long long'` is at least as large as an `:c:type:'off_t'`. It may be necessary to configure and compile Python with certain compiler flags to enable this mode. For example, with Solaris 2.6 and 2.7 you need to do something like:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 46); [backlink](#)

Unknown interpreted text role "c:type".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 46); [backlink](#)

Unknown interpreted text role "c:type".

```
CFLAGS="`getconf LFS_CFLAGS`" OPT="-g -O2 $CFLAGS" \  
./configure
```

On large-file-capable Linux systems, this might work:

```
CFLAGS='-D_LARGEFILE64_SOURCE -D_FILE_OFFSET_BITS=64' OPT="-g -O2 $CFLAGS" \  
./configure
```

Notable Module Contents

In addition to many functions described in the `mod:os` module documentation, `mod:posix` defines the following data item:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 67); [backlink](#)

Unknown interpreted text role "mod".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]posix.rst, line 70)

Unknown directive type "data".

```
.. data:: environ
```

A dictionary representing the string environment at the time the interpreter was started. Keys and values are bytes on Unix and str on Windows. For example, ```environ[b'HOME']``` (```environ['HOME']``` on Windows) is the pathname of your home directory, equivalent to ```getenv("HOME")``` in C.

Modifying this dictionary does not affect the string environment passed on by `:func:`~os.execv``, `:func:`~os.popen`` or `:func:`~os.system``; if you need to change the environment, pass ```environ``` to `:func:`~os.execve`` or add variable assignments and export statements to the command string for `:func:`~os.system`` or `:func:`~os.popen``.

```
.. versionchanged:: 3.2  
   On Unix, keys and values are bytes.
```

```
.. note::
```

The `mod:os` module provides an alternate implementation of ```environ``` which updates the environment on modification. Note also that updating `:data:os.environ` will render this dictionary obsolete. Use of the `mod:os` module version of this is recommended over direct access to the `mod:posix` module.
