

Prevent usage of Session (no-session)

This rule prevents any usage of Session. Session variables live in a global namespace, which is bad practice. [reactive-dict](#) should be used instead.

Rule Details

This rule enforces a style without `Session`.

The following patterns are considered warnings:

```
Session.set('foo')
Session.get('foo')
Session.all()
Session.clear()
```

The following patterns are not warnings:

```
Session = true
console.log(Session)
```

When Not To Use It

If you are working on a project using few globals then you can disable this rule.
